(54) Title: PHENYLPROPYNYLOXYPYRIDINE HERBICIDES

(57) Abstract: Compounds of formula (I) wherein the substituents R_1 , R_2 , R_3 and R_4 , and the suffixes n and m are as defined in claim 1, and agrochemically acceptable salts and all stereoisomers and tautomers of such compounds are suitable for use as herbicides.

Novel herbicides

The present invention relates to novel, herbicidally active phenylalkynes, to a process for their preparation, to compositions comprising such compounds, and to the use thereof in controlling weeds, especially in crops of useful plants, or in inhibiting plant growth.

Phenylalkynes having herbicidal action are described, for example, in JP-A-11 147 866.

Novel phenylalkynes having herbicidal and growth-inhibiting properties have now been found.

Preference is given also to compounds of formula I wherein

m is 1 or 2, and R₂ occupies the 3-position on the phenyl ring.

R₂ is cyanomethyl, chlorine or bromine;

R₃ and R₄ are hydrogen;

n is 1 or 2, and

The compounds of formula I can be prepared by processes known *per se* described, for example, in J. Chem. Soc. Perkin Trans. 1979, pages 2756-2761; Synth. Commun. 1988, 18, pages 1111-1118; J. Org Chem. 1996, 61, pages 4258-4261; and K. Sonogashira, Comprehensive Organic Synthesis 1991, Vol. 3, page 521, for example, by reacting a compound of formula II

wherein R₁ is as defined for formula I, in the presence of a base, with a compound of formula III

wherein R₃ and R₄ are as defined for formula I and X₁ is O-tosyl, chlorine, bromine or iodine, to form a compound of formula IV

wherein R_1 , R_3 and R_4 are as defined for formula I, and then coupling that compound, in the presence of a palladium catalyst, with a compound of formula V

wherein R_2 is as defined for formula I and A is a leaving group, such as halogen or trifluoromethanesulfonate.

The preparation of the compounds of formula I can be carried out, for example, in accordance with Reaction Schemes 1, 2, 3, 4, 5 and 6. For the individual synthesis schemes, it is generally the case that different R_1 substituents may already be present at the start, or can be introduced in succession, for example by nucleophilic substitution.

According to Reaction Scheme 1, the compounds of formula I can be obtained, for example, from substituted pyridyl propargyl ethers of formula IV.

The propargyl ethers of formula IV can be obtained in advance by alkylation of hydroxypyridines of formula II, which are reacted with acetylene derivatives III in the presence of a base. Such alkylations are standard procedures and can be carried out, for example, analogously to J. Chem. Soc. Perkin Trans. 1979, pages 2756-2761; Synth. Commun. 1988, 18, pages 1111-1118; and J. Org Chem. 1996, 61, pages 4258-4261.

In the next Step, the propargyl ethers of formula IV are coupled with substituted aryls of formula V under typical Sonogashira conditions (K. Sonogashira, Comprehensive Organic Synthesis 1991, Vol. 3, page 521). As catalyst mixtures there come into consideration, for example, tetrakis(triphenylphosphine)palladium or bis(triphenylphosphine)palladium dichloride together with copper iodide; as bases (for the reductive elimination) there come into consideration preferably amines, for example triethylamine, diethylamine or diisopropylethylamine.

The aryls of formula V preferably carry a leaving group A, wherein A is, for example, halogen (N. Krause *et al.*, J. Org. Chem. 1998, 63, page 8551; and Nakamura, H. *et al.*, Tetrahedron Lett. 2000, 41, page 2185) or trifluoromethanesulfonate (Ritter, K., Synthesis 1993, page 735). As solvents there are customarily used ethers, for example tetrahydrofuran,

chlorinated hydrocarbons, for example chloroform, or dipolar aprotic solvents, for example dimethylformamide or dimethyl sulfoxide.

Scheme 1

Sonogashira coupling:

The Pd-catalysed cross-coupling of suitably substituted benzenes of formula V with propargyl alcohols or terminal acetylenes of formula VI is generally known as a Sonogashira reaction (Reaction Scheme 2). That reaction has already been depicted in detail (see above, Scheme 1) and can also be used for the preparation of the phenylpropargyl alcohols of formula VII.

The activation of the alcohol of formula VII is achieved, for example, by tosylation or halogenation. The tosylation of the alcohol of formula VII is a standard reaction and can be carried out, for example, with a sulfonic acid chloride, for example mesyl chloride or para-toluenesulfonic acid chloride (p-TosCl) in the presence of an amine, for example diethylamine, triethylamine or pyridine, in a solvent, e.g. a chlorinated hydrocarbon, for example carbon tetrachloride or methylene chloride, or an amine, for example pyridine. Such

reactions are generally known and are described, for example, in J. Org. Chem. 1997, 62, page 8987; J. Het. Chem. 1995, 32, pages 875-882; and Tetrahedron Lett. 1997, 38, pages 8671-8674.

The halogenation can be carried out analogously to standard procedures. For example, bromination is effected using carbon tetrabromide in the presence of triphenylphosphine (Synthesis 1998, pages 1015-1018) in methylene chloride. Chlorination is effected using mineral acids, for example using concentrated hydrochloric acid (J. Org. Chem. 1955, 20, page 95) or using para-toluenesulfonic acid chloride in the presence of an amine, for example triethylamine, in a solvent, for example methylene chloride (Tetrahedron Lett. 1984, 25, page 2295).

The preparation of the phenyl-propynyloxy-pyridines of formula I can be carried out analogously to Synthesis 1995, pages 707-712; and Tetrahedron Lett. 1994, 35, pages 6405-6408 by means of copper iodide-catalysed alkylation. Suitable solvents are dimethylformamide and acetonitrile; suitable bases are preferably potassium carbonate and 1,8-diazabicyclo[5.4.0]-undec-7-ene (DBU).

Scheme 2

Compounds of formula I can also be obtained according to other methods (see Scheme 3).

Scheme 3

Phenylacetylene esters of formula X can be obtained by means of Sonogashira coupling from the compounds of formula IX and activated benzene derivatives of formula V. The esters of formula X can then be reduced or reacted with organometal compounds, for example Grignard reagents, to form the alcohols of formula VII.

The reduction can be carried out preferably with hydrides according to standard methods, for example with lithium aluminium hydride or sodium borohydride in a solvent, e.g. an ether, for example diethyl ether, dioxane or tetrahydrofuran, or an alcohol, for example methanol or ethanol. Such reductions are described, for example, in C. Ferri, "Reaktionen der organischen Synthese" 1978, pages 98-102.

Reactions of carboxylic acid esters with Grignard reagents are standard in organic synthesis chemistry and are described in detail, for example, in "Organikum" 1976, pages 617-625.

The subsequent etherification of the pyridyl derivatives of formula II to form the compounds of formula I has already been depicted in detail in Scheme 2.

Further methods of preparing the compounds of type I are shown in Scheme 4 (variant of Scheme 3).

Scheme 4

The reaction of phenylacetylenes of formula XI with methyllithium and subsequent reaction with chloroformic acid ethyl ester of formula XII yields the ester of formula Xa, which can be converted to the compounds of type I *via* an alcohol of formula VII in a manner completely analogous to that already shown in Scheme 3 (Tetrahedron. Lett. 1992, 33, page 4495).

The nucleophilic aromatic substitution of the pyridine derivatives of formula XIV, wherein X_2 is halogen (Reaction Scheme 5) can be carried out analogously to known procedures, as described, for example, in J. March, "Advanced Organic Chemistry" 4th Edition, John Wiley & Sons, New York, 1992, pages 641-676. Accordingly the pyridine derivative of formula XIV is reacted with a propargyl alcohol of formula VII in an aprotic solvent, e.g. an amide, for example N,N-dimethylformamide (DMF) or 1-methyl-2-pyrrolidone (NMP), a sulfoxide, for example dimethyl sulfoxide (DMSO), a ketone, for example acetone, or an ether, for example tetrahydrofuran (THF), in the presence of a base, e.g. a carbonate, for example potassium or caesium carbonate, or a metal hydride, for example sodium hydride, at temperatures of from 0°C to 100°C (see also EP-A-0 759 429).

Scheme 5

nucleophilic substitution:

XIV: X_2 = halogen

Compounds of formula I can also be prepared by first reacting the propargyl alcohols of formula XV with the pyridine derivatives of formula XIV to form compounds of formula XVI and only then in the next synthesis step carrying out a Sonogashira reaction with activated benzene derivatives of formula V (Reaction Scheme 6).

Scheme 6

For the individual reaction steps (Schemes 1 to 6) the following applies:

The reactions to form compounds of formula I are advantageously carried out in aprotic, inert organic solvents. Such solvents are hydrocarbons, such as benzene, toluene, xylene or cyclohexane, chlorinated hydrocarbons, such as dichloromethane, trichloromethane, tetrachloromethane or chlorobenzene, ethers, such as diethyl ether, ethylene glycol dimethyl ether, diethylene glycol dimethyl ether, tetrahydrofuran or dioxane, nitriles, such as acetonitrile or propionitrile, or amides, such as N,N-dimethylformamide, diethylformamide or N-methylpyrrolidinone. The reaction temperatures are preferably from -20°C to $+120^{\circ}\text{C}$. The reactions are generally slightly exothermic and can usually be carried out at room temperature. In order to shorten the reaction time or to initiate the reaction, it is optionally possible to heat the reaction mixture for a short time up to boiling point. The reaction times can also be reduced by the addition of a few drops of base as reaction catalyst. Suitable bases are especially tertiary amines, such as trimethylamine, triethylamine, quinuclidine, 1,4-diazabicyclo[2.2.2]octane, 1,5-diazabicyclo[4.3.0]non-5-ene or 1,5-diazabicyclo[5.4.0]undec-7-ene. The bases used can, however, also be inorganic bases, such as hydrides, such as

sodium or calcium hydride, hydroxides, such as sodium or potassium hydroxide, carbonates, such as sodium or potassium carbonate, or hydrogen carbonates, such as potassium or sodium hydrogen carbonate.

The compounds of formula I can be isolated in customary manner by concentration and/or evaporation of the solvent and can be purified by recrystallisation or trituration of the solid residue in solvents in which they are not readily soluble, such as ethers, aromatic hydrocarbons or chlorinated hydrocarbons.

For the use of the compounds of formula I according to the invention or compositions comprising them, there are suitable any of the methods of application customary in agriculture, such as preemergence application, postemergence application and seed dressing, as well as various methods and techniques, such as the controlled release of active ingredient. In the latter method, the compound is applied in solution to mineral granule carriers or polymerised granules (urea/formaldehyde) and dried. Where appropriate, it is possible in addition to apply a coating (coated granules) which allows the active ingredient to be released in metered amounts over a specific period.

The compounds of formula I can be used as herbicides in unmodified form, i.e. as obtained during synthesis, but are preferably formulated in customary manner together with the adjuvants conventionally employed in formulation technology, e.g. into emulsifiable concentrates, directly sprayable or dilutable solutions, dilute emulsions, wettable powders, soluble powders, dusts, granules and microcapsules. Such formulations are described, for example, in WO 97/34485 on pages 9 to 13. As with the nature of the compositions, the methods of application, such as spraying, atomising, dusting, wetting, scattering or pouring, are chosen in accordance with the intended objectives and the prevailing circumstances.

The formulations, i.e. the compositions, preparations or mixtures comprising the compound of formula I or at least one compound of formula I and generally one or more solid or liquid formulation adjuvants, are prepared in known manner, e.g. by intimately mixing and/or grinding the active ingredients with the formulation adjuvants, e.g. solvents or solid carriers. Surface-active compounds (surfactants) may additionally be used in the preparation of the formulations. Examples of solvents and solid carriers are given, for example, in WO 97/34485 on page 6.

Depending on the nature of the compound of formula I to be formulated, suitable surface-active compounds are non-ionic, cationic and/or anionic surfactants and surfactant mixtures having good emulsifying, dispersing and wetting properties.

Examples of suitable anionic, non-ionic and cationic surfactants are listed, for example, in WO 97/34485 on pages 7 and 8. The surfactants customarily employed in formulation technology, which are described *inter alia* in "McCutcheon's Detergents and Emulsifiers Annual" MC Publishing Corp., Ridgewood New Jersey, 1981, Stache, H., "Tensid-Taschenbuch", Carl Hanser Verlag, Munich/Vienna, 1981 and M. and J. Ash, "Encyclopedia of Surfactants", Vol I-III, Chemical Publishing Co., New York, 1980-81, are also suitable for the preparation of the herbicidal compositions according to the invention.

The herbicidal formulations generally contain from 0.1 to 99 % by weight, especially from 0.1 to 95 % by weight, herbicide, from 1 to 99.9 % by weight, especially from 5 to 99.8 % by weight, of a solid or liquid formulation adjuvant and from 0 to 25 % by weight, especially from 0.1 to 25 % by weight, of a surfactant. Whereas commercial products are preferably formulated as concentrates, the end user will normally employ dilute formulations. The compositions may also comprise further ingredients such as stabilisers, e.g. vegetable oils and epoxidised vegetable oils (epoxidised coconut oil, rape oil or soybean oil), anti-foams, e.g. silicone oil, preservatives, viscosity regulators, binders and tackifiers, as well as fertilisers or other active ingredients.

The compounds of formula I are usually applied to the plants or to the locus thereof at rates of application of from 0.001 to 4 kg/ha, especially from 0.005 to 2 kg/ha. The concentration required to achieve the desired action can be determined by experimentation. It will depend on the type of action, the development stage of the crop plant and of the weed, as well as on the application (locus, time, method) and, in dependence on those parameters, can vary over a wide range.

The compounds of formula I are distinguished by herbicidal and growth-inhibiting properties, which make them suitable for use in crops of useful plants, especially in cereals, cotton, soybeans, sugar beet, sugar cane, plantation crops, rape, maize and rice, and for the non-selective control of weeds. Crops will be understood to include also those crops that have been made tolerant to herbicides or classes of herbicides by conventional breeding or genetic engineering methods. The weeds to be controlled may be monocotyledonous as well as dicotyledonous weeds, for example *Stellaria*, *Nasturtium*, *Agrostis*, *Digitaria*, *Avena*, *Setaria*, *Sinapis*, *Lolium*, *Solanum*, *Echinochloa*, *Scirpus*, *Monochoria*, *Sagittaria*, *Bromus*,

Alopecurus, Sorghum halepense, Rottboellia, Cyperus, Abutilon, Sida, Xanthium, Amaranthus, Chenopodium, Ipomoea, Chrysanthemum, Galium, Viola and Veronica.

The following Examples illustrate the invention further, but do not limit the invention.

Preparation Examples:

Example P1: Preparation of 3,5-dichloro-2-(prop-2-ynyloxy)-pyridine:

1.25 g (0.029 mol) of NaH (55 %) are placed in 30 ml of pentane. After 15 minutes' stirring under nitrogen, the solvent is removed by syringe. 20 ml of absolute THF are then added and 1.65 ml (0.028 mol) of propargyl alcohol are added dropwise over a period of about 5 minutes at a temperature of 0°C. When the addition is complete, the ice-cooling is removed and stirring is continued for a further one hour at a temperature of about 45°C until the evolution of gas has ceased. 4.8 g (0.025 mol) of 2,3,5-trichloropyridine dissolved in 5 ml of THF are then added dropwise, with stirring, at 45°C. Stirring is then carried out for 6 hours at a temperature of 45°C and for 18 hours at a temperature of 20°C, until gas chromatography indicates complete conversion. The reaction mixture is then neutralised cautiously with 1N HCl, a small amount of saturated aqueous sodium chloride is added and extraction with ethyl acetate is carried out a total of three times. The combined organic phases are dried over magnesium sulfate. After filtration and removal of the ethyl acetate by evaporation, 5.0 g of 3,5-dichloro-2-(prop-2-ynyloxy)-pyridine are obtained in the form of a pale yellow oil, which corresponds to a quantitative conversion.

Example P2: Preparation of {3-[3-(3,5-dichloropyridin-2-yloxy)-prop-1-ynyl]-phenyl}-acetonitrile:

486 mg (2.0 mmol) of 3-iodo-1-phenylacetonitrile, 17.1 mg (0.09 mmol) of CuI and 126 mg (0.18 mmol) of Pd(PPh₃)₂Cl₂ are dissolved at 20°C in 10 ml of THF under argon. After 15 minutes' stirring, 0.56 ml (4.0 mmol) of triethylamine is added. A solution of 444 mg (2.2 mmol) of 3,5-dichloro-2-(prop-2-ynyloxy)-pyridine (Example P1) in 3 ml of THF is then added dropwise over a period of 30 minutes. After a further 16 hours' stirring at 20°C, the THF is distilled off, 50 ml of water are added to the residue, and extraction is carried out with a total of about 120 ml of ethyl acetate. After separation of the organic phase, drying over magnesium sulfate and filtration, concentration by evaporation is carried out. The dark residue is purified by chromatography (eluant: ethyl acetate/hexane 1/4). 300 mg of {3-[3-(3,5-dichloropyridin-2-yloxy)-prop-1-ynyl]-phenyl}-acetonitrile are obtained in solid form having a melting point of from 70 to 72°C.

Example P3: Preparation of 5-bromo-2-(prop-2-ynyloxy)-pyridine:

0.54 g (0.011 mol) of NaH (55 %) is suspended in 15 ml of absolute THF under nitrogen. 0.67 ml (0.011 mol) of propargyl alcohol is then added dropwise over a period of about 5 minutes at a temperature of 0°C. When the addition is complete, the ice-cooling is removed and stirring is carried out for 30 minutes at a temperature of about 20°C until the evolution of gas has ceased. 2.0 g (0.011 mol) of 5-bromo-2-fluoropyridine dissolved in 5 ml of THF are then added dropwise at 20-30°C, with stirring and ice-cooling. Stirring is then carried out for a further 2 hours at room temperature until gas chromatography indicates complete conversion. The reaction mixture is then cautiously poured into 40 ml of water and extraction with ethyl acetate is carried out a total of three times. The combined organic phases are dried over sodium sulfate. After filtration and removal of the ethyl acetate by

evaporation, 2.1 g of 5-bromo-2-(prop-2-ynyloxy)-pyridine are obtained in the form of beige crystals having a melting point of 58-60°C.

Example P4: Preparation of 5-chloro-3-fluoro-2-(prop-2-ynyloxy)-pyridine:

8.0 g (0.167 mol) of NaH (55 %) are suspended in 200 ml of absolute THF under nitrogen. 9.9 ml (0.167 mol) of propargyl alcohol dissolved in 10 ml of absolute THF are then added dropwise over a period of about 10 minutes at a temperature of 0°C. When the addition is complete, the ice-cooling is removed and stirring is carried out at room temperature for 45 minutes until the evolution of gas has ceased. 25 g (0.167 mol) of 5-chloro-2,5-difluoropyridine dissolved in 50 ml of THF are then added dropwise at 20-30°C, with stirring and ice-cooling. Stirring is carried out for a further 3 hours at room temperature until gas chromatography indicates complete conversion. The reaction mixture is then cautiously poured into 250 ml of water and extraction with ethyl acetate is carried out a total of three times. After separation of the organic phase, drying over sodium sulfate and filtration, concentration by evaporation is carried out. The yellow residue is purified by chromatography (eluant: ethyl acetate/hexane 1/4). 19.1 g of 5-chloro-3-fluoro-2-(prop-2-ynyloxy)-pyridine are obtained in the form of a colourless oil.

Example P5: Preparation of 5-chloro-3-methoxy-2-(prop-2-ynyloxy)-pyridine:

1.0 g (5.4 mmol) of 5-chloro-3-fluoro-2-(prop-2-ynyloxy)-pyridine (Example P4) are placed in 15 ml of methanol under nitrogen. 2.0 ml (10.8 mmol) of a 30 % sodium methanolate solution in methanol are then added dropwise over a period of about 5 minutes at room temperature. When the addition is complete, the reaction mixture is heated to reflux and stirred at that temperature for a further 18 hours. The reaction mixture is cooled to room temperature and 30 ml of water are then added cautiously. Extraction with ethyl acetate is then carried out three times. After separation of the organic phase, drying over sodium sulfate and filtration, concentration by evaporation is carried out. The yellowish residue is purified by chromatography (eluant: ethyl acetate/hexane 1/4). 0.65 g of 5-chloro-3-methoxy-

2-(prop-2-ynyloxy)-pyridine is obtained in the form of colourless crystals having a melting point of 62-64°C.

Example P6: Preparation of {3-[3-(5-bromopyridin-2-yloxy)-prop-1-ynyl]-phenyl}-acetonitrile:

486 mg (2.0 mmol) of 3-iodo-1-phenylacetonitrile, 424 mg (2.0 mmol) of 5-bromo-2-(prop-2-ynyloxy)-pyridine (Example P3) and 80 mg (0.11 mmol) of $\text{Pd}(\text{PPh}_3)_2\text{Cl}_2$ are dissolved at a temperature of 0°C in a mixture of 10 ml of chloroform and 4 ml of triethylamine under argon. After 15 minutes' stirring, 36 mg (0.19 mmol) of CuI are added. After a further 18 hours' stirring at a temperature of 0°C, the reaction mixture is filtered through a small amount of silica gel. The filtrate is concentrated by evaporation and the dark residue is purified by chromatography (eluant: ethyl acetate/hexane 1/4). 180 mg of {3-[3-(5-bromopyridin-2-yloxy)-prop-1-ynyl]-phenyl}-acetonitrile are obtained in solid form having a melting point of 121-123°C.

Example P7: Preparation of 5-chloro-2-[3-(4-chlorophenyl)-prop-2-ynyloxy]-3-methoxy-pyridine:

112 mg (0.47 mmol) of 1-iodo-4-chlorobenzene, 94 mg (0.47 mmol) of 5-chloro-3-methoxy-2-(prop-2-ynyloxy)-pyridine (Example P5) and 34 mg (0.047 mmol) of $\text{Pd}(\text{PPh}_3)_2\text{Cl}_2$ are dissolved at a temperature of -78°C in a mixture of 5 ml of methanol and 0.335 ml (2.4 mmol) of triethylamine under argon. After 15 minutes' stirring, 27 mg (0.14 mmol) of CuI are added. The reaction mixture is left for 18 hours, with stirring, to warm to room temperature and is then filtered through a small amount of silica gel. The filtrate is concentrated by evaporation and the dark residue is purified by chromatography (eluant:

ethyl acetate/hexane 1/4). 37 mg of 5-chloro-2-[3-(4-chlorophenyl)-prop-2-ynyloxy]-3-methoxypyridine are obtained in solid form having a melting point of 109-110°C.

Biological ExamplesExample B1: Herbicidal action before emergence of the plants (pre-emergence action)

Monocotyledonous and dicotyledonous test plants are sown in standard soil in pots. Immediately after sowing, an aqueous suspension of the test compounds (prepared from a wettable powder (Example F3, b) according to WO 97/34485) or an emulsion of the test compounds (prepared from an emulsifiable concentrate (Example F1, c) according to WO 97/34485) is applied by spraying at an optimum rate of application (500 litres of water/ha). The test plants are then cultivated in a greenhouse under optimum conditions.

After a test duration of 4 weeks, the test is evaluated in accordance with a scale of nine ratings (1 = total damage, 9 = no action). Ratings of from 1 to 4 (especially from 1 to 3) indicate good to very good herbicidal action.

Test plants: Setaria, Panicum, Digitaria, Amaranthus, Stellaria, Veronica.

Example B2: Post-emergence herbicidal action

Monocotyledonous and dicotyledonous test plants are sown in standard soil in pots, and at the 2- to 3-leaf stage are sprayed with an aqueous suspension of the test compounds (prepared from a wettable powder (Example F3, b) according to WO 97/34485) or with an emulsion of the test compounds (prepared from an emulsifiable concentrate (Example F1, c) according to WO 97/34485) at an optimum rate of application of 500 litres of water/ha). The test plants are then grown on in the greenhouse under optimum conditions.

After a test duration of 2 to 3 weeks, the test is evaluated in accordance with a scale of nine ratings (1 = total damage, 9 = no action). Ratings of from 1 to 4 (especially from 1 to 3) indicate good to very good herbicidal action.

Test plants: Panicum, Euphorbia, Sida, Amaranthus, Chenopodium, Stellaria, Veronica.
